Ouestion 1 Reccurence

$$T(n) = 3T(\frac{n}{4}) + 4n$$

$$= 3(3T(\frac{n}{16}) + n) + 4n = 9T(\frac{n}{16}) + 4n + 3n$$

$$= 3(3(3T(\frac{n}{64}) + \frac{n}{4}) + n) + 4n = 27T(\frac{n}{64}) + 4n + 3n + \frac{9n}{4}$$

$$= 3(3(3(3T(\frac{n}{256}) + \frac{n}{16}) + \frac{n}{4}) + n) + 4n = 81T(\frac{n}{256}) + 4n + 3n + \frac{9n}{4} + \frac{27n}{16}$$

After the jth substitution for all $j \ge 1$

$$T(n) = 3^{j} T(\frac{n}{4^{j}}) + \sum_{i=1}^{j} \frac{(4)(3^{j-1})n}{4^{j-1}}$$

$$f(n) = 4n = \theta(n^1)$$

Thus a=3, b=4,d=1

Then case 1 applies since $3 < 4^1$

Hence,

 $T(n)=\theta(n)$

Question 4 Double Hashing

Assuming Reverse(6) = 60

25 – initial 0, 0 collisions

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |

Question 7 Algorithm Analysis

Question 4 was done by hand

#5: time complexity – O(n*k) where n is the number of strings in the given array and k is the maximum amount characters in the strings. This is because we iterate and compare each string in the array k times comparing the kth element from the right each iteration for n iterations.

Space complexity -O(n) since the 256 buckets can hold a total of n strings where n is the length of th given string array

#6 time complexity -O(m + n) where m is the length of the given string and n is the length of the given pattern. Goes through each character in the given string and then does another comparison depending on how many characters there are the pattern.

Space complexity -O(m+n) where m is the length of the given string and n is the length of the given pattern. This is because since each substring takes new space there can a maximum of m space created for the substrings and a max of n spaces can be created for the pattern if each character in the pattern is different
